
DERMATOPATHOLOGY REPORT

Patient Name:

Submitting Provider:

Age: **DOB:**
Sex: F **Race:**

Accession Number:

Collected: 10/27/2014
Received: 10/28/2014
Reported: 10/29/2014

DIAGNOSIS:

COMPOUND DYSPLASTIC NEVUS WITH MILD DYSPLASIA, NOT EXCISED (L. Lower Back)

Biopsy Site - Clinical Impression:

L. Lower Back (R/O DN)

Gross Description:

The specimen is received in formalin and consists of a shave biopsy of tan-brown skin measuring 13 x 7 x 1 mm. The specimen is serially sectioned and entirely submitted in one cassette.

Microscopic Description:

The specimen is a segment of skin. There is a proliferation of nevus cells arranged individually and as nests and cords at the dermal-epidermal junction and in the upper dermis. The nests are slightly irregular in size and shape and exhibit bridging. There is mild atypia of nevus cells. There is fibrosis and chronic inflammation in the dermis.

Samir B. Patel, MD
Board Certified Dermatopathologist

The quality of the stains and controls were acceptable for interpretation.
