
DERMATOPATHOLOGY REPORT

Patient Name:

Submitting Provider:

Age: **DOB:**

Sex: F **Race:**

Accession Number:

Collected: 10/09/2014

Received: 10/10/2014

Reported: 10/14/2014

DIAGNOSIS:

A - HIGHLY CONSISTENT WITH LICHEN PLANOPILARIS, SEE NOTE (Vertex Scalp)

NOTE: This case was reviewed in conjunction with the office visit note and clinical photograph provided (dated September 9, 2014). Deeper sections were performed.

B - INFLAMED FIBROMA (L. Flank)

Biopsy Site - Clinical Impression:

A: Vertex Scalp (LPP, DLE)

B: L. Flank (R/O Irritated Nevus)

Gross Description:

- A - The specimen is received in formalin and consists of a punch biopsy of gray-tan skin measuring 3 mm in diameter, excised to a depth of 4 mm. The specimen is entirely submitted in one cassette.
- B - The specimen is received in formalin and consists of a gray-tan polypoid fragment of tissue measuring 8 x 7 x 10 mm. The specimen is bisected and entirely submitted in one cassette.

Microscopic Description:

- A - The specimen is a segment of skin. There is a moderate perivascular and perifollicular lymphocytic infiltrate with perifollicular fibroplasia and atrophy/destruction of hair follicles. The infiltrate is primarily centered around the infundibulum and isthmus of the hair follicles. There is dermal fibrosis.
- B - The specimen is a segment of skin. There is an exophytic nodule with slight fibrosis, ectatic vessels, and chronic inflammation.

Samir B. Patel, MD
Board Certified Dermatopathologist

The quality of the stains and controls were acceptable for interpretation.
